There is a considerable need and desire for diagnostic labs to be able to check each others databases for the presence of mutations they observe in their own patients.

But this is countered by the understandable reluctance and impracticality of sharing the content of each group's database with other labs, or indeed with the wider world.

To achieve this, Cafe Variome facilitates the "publication" of data from researchers, diagnostics laboratories, and others, to any and all stakeholders who may wish to, for example, check for evidence of causal influence upon certain disease states, and/or incorporate the data into locus-specific databases (LSDBs).

The Cafe Variome Concept

Cafe Variome for Disease Networks

Use Cafe Variome to share variants between private networks of laboratories/groups

Intuitive admin interface and sharing dashboard gives you fine grained access control over variants, sources, users and groups

Installs can be hosted by the Cafe Variome Team or installed on your own server

Admin Dashboard

Variants can be imported in a variety of formats

Create different sources for variants

Group level access control for variants, sources and users

Email: admin@cafevariome.org for a demo or to discuss your requirements

The research leading to these results has received funding from the European Community's Seventh Framework Programme (FP7/2007-2013) under grant agreement no. 200754 - the GEN2PHEN project.
