“Facilitating the exchange of sequence variant data from diagnostic laboratories to diverse third parties”

The internet-based Cafe Variome is designed to function as a advertising platform and exchange portal for gene mutation data produced by diagnostics laboratories, offering users an environment through which to announce, discover and acquire a comprehensive listing of observed neutral and disease-causing gene mutations in patients and unaffected individuals.

To achieve this, Cafe Variome facilitates the “publication” of data from researchers, diagnostics laboratories, and others, to any and all stakeholders who may wish to, for example, check for evidence of causal influence upon certain disease states, and/or incorporate the data into locus-specific databases (LSDBs).

The Cafe Variome Concept

Cafe Variome features...

- Automated and/or manual data submissions, from registered submitters
- Users "discover" mutations by online search interface & webservice (for programmatic access)
- Various data access options, leaving control at all times with the submitter
- Attribution/accreditation given to data creators working in diagnostic labs (as is the case for publishing journal articles)

Use Cafe Variome to share your data...

- Submit variants using Cafe Variome-enabled software
- Cafe Variome will work with you and do all the heavy lifting required to process any historic or large datasets
- We will work with you to set up automated pipelines for routinely sharing and publishing variants
- Contact admin@cafevariome.org

The research leading to these results has received funding from the European Community's Seventh Framework Programme (FP7/2007-2013) under grant agreement no. 200754 - the GEN2PHEN project.
